

# Real Time Operating System “FreeRTOS” Part 2

# Agenda

- Accurate task periods
- Continuous & Periodic Tasks
- Changing Tasks priorities
- Deleting tasks

- **vTaskDelayUntil()** is similar to **vTaskDelay()** “but”
- **vTaskDelay()** parameter specifies the number of tick interrupts that should occur between a task calling **vTaskDelay()** and the same task once again transitioning out of the Blocked state.
- The length of time the task remains in the blocked state is specified by the **vTaskDelay()** parameter, but the actual time at which the task leaves the blocked state is relative to the time at which **vTaskDelay()** was called.
- The parameters to **vTaskDelayUntil()** specify, instead, the exact tick count value at which the calling task should be moved from the Blocked state into the Ready state.
- **vTaskDelayUntil()** is the API function that should be used when a fixed execution period is required (where you want your task to execute periodically with a fixed frequency), as the time at which the calling task is unblocked is absolute, rather than relative to when the function was called (as is the case with **vTaskDelay()**).
- **vTaskDelayUntil()** API function is available only when **INCLUDE\_vTaskDelayUntil** is set to 1 in **FreeRTOSConfig.h**.

# Accurate Tasks Periods

```
void vTaskFunction( void *pvParameters )
{
    char *pcTaskName;
    portTickType xLastWakeTime;

    /* The string to print out is passed in via the parameter. Cast this to a
    character pointer. */
    pcTaskName = ( char * ) pvParameters;

    /* The xLastWakeTime variable needs to be initialized with the current tick
    count. Note that this is the only time the variable is written to explicitly.
    After this xLastWakeTime is updated automatically internally within
    vTaskDelayUntil(). */
    xLastWakeTime = xTaskGetTickCount();

    /* As per most tasks, this task is implemented in an infinite loop. */
    for( ;; )
    {
        /* Print out the name of this task. */
        vPrintString( pcTaskName );

        /* This task should execute exactly every 250 milliseconds. As per
        the vTaskDelay() function, time is measured in ticks, and the
        portTICK_RATE_MS constant is used to convert milliseconds into ticks.
        xLastWakeTime is automatically updated within vTaskDelayUntil() so is not
        explicitly updated by the task. */
        vTaskDelayUntil( &xLastWakeTime, ( 250 / portTICK_RATE_MS ) );
    }
}
```

# Example 6: Continuous & Periodic Tasks

```
void vContinuousProcessingTask( void *pvParameters )
{
    char *pcTaskName;

    /* The string to print out is passed in via the parameter.  Cast this to a
    character pointer. */
    pcTaskName = ( char * ) pvParameters;

    /* As per most tasks, this task is implemented in an infinite loop. */
    for( ;; )
    {
        /* Print out the name of this task.  This task just does this repeatedly
        without ever blocking or delaying. */
        vPrintString( pcTaskName );
    }
}
```

Listing 15. The continuous processing task used in Example 6

```
void vPeriodicTask( void *pvParameters )
{
    portTickType xLastWakeTime;

    /* The xLastWakeTime variable needs to be initialized with the current tick
    count.  Note that this is the only time the variable is explicitly written to.
    After this xLastWakeTime is managed automatically by the vTaskDelayUntil()
    API function. */
    xLastWakeTime = xTaskGetTickCount();

    /* As per most tasks, this task is implemented in an infinite loop. */
    for( ;; )
    {
        /* Print out the name of this task. */
        vPrintString( "Periodic task is running.....\n" );

        /* The task should execute every 10 milliseconds exactly. */
        vTaskDelayUntil( &xLastWakeTime, ( 10 / portTICK_RATE_MS ) );
    }
}
```

Listing 16. The periodic task used in Example 6

# Example 6: Continuous & Periodic Tasks

- 1\_three\_tasks\_same\_priority
- 2\_three\_tasks\_different\_priority
- 3\_three\_tasks\_preemption\_delete\_task (Example 9)

# Deleting a Task; Example 9

```
int main( void )
{
    /* Create the first task at priority 1. The task parameter is not used
    so is set to NULL. The task handle is also not used so likewise is set
    to NULL. */
    xTaskCreate( vTask1, "Task 1", 240, NULL, 1, NULL );
    /* The task is created at priority 1 _____^ */

    /* Start the scheduler so the task starts executing. */
    vTaskStartScheduler();

    /* main() should never reach here as the scheduler has been started. */
    for( ;; );
}
```

Listing 26. The implementation of main() for Example 9

```
void vTask1( void *pvParameters )
{
    const portTickType xDelay100ms = 100 / portTICK_RATE_MS;

    for( ;; )
    {
        /* Print out the name of this task. */
        vPrintString( "Task 1 is running\n" );

        /* Create task 2 at a higher priority. Again the task parameter is not
        used so is set to NULL - BUT this time the task handle is required so
        the address of xTask2Handle is passed as the last parameter. */
        xTaskCreate( vTask2, "Task 2", 240, NULL, 2, &xTask2Handle );
        /* The task handle is the last parameter _____^^^^^^^^^^^^^^^^ */

        /* Task 2 has/had the higher priority, so for Task 1 to reach here Task 2
        must have already executed and deleted itself. Delay for 100
        milliseconds. */
        vTaskDelay( xDelay100ms );
    }
}
```

Listing 27. The implementation of Task 1 for Example 9

```
void vTask2( void *pvParameters )
{
    /* Task 2 does nothing but delete itself. To do this it could call vTaskDelete()
    using NULL as the parameter, but instead and purely for demonstration purposes it
    instead calls vTaskDelete() passing its own task handle. */
    vPrintString( "Task2 is running and about to delete itself\n" );
    vTaskDelete( xTask2Handle );
}
```
